

AALBORG UNIVERSITET

CURRICULUM FOR THE MASTER OF SCIENCE (MSC) PROGRAMME IN ENERGY ENGINEERING 2017

MASTER OF SCIENCE (MSC) IN ENGINEERING
AALBORG

MODULES INCLUDED IN THE CURRICULUM

TABLE OF CONTENTS

Fluid Mechanical Analysis Methods 2018/2019	4
Problem Based Project Organised Learning in Thermo-Mechanical Analysis Methods (INTRO) 2018/2019 .. 7	
Computational Fluid Dynamics (CFD) and Multiphase Flow 2018/2019	9
Fluid Mechanics and Compressible Flow 2018/2019	11
Probability Theory, Stochastic Processes and Applied Statistics 2018/2019	13
Control Theory and MATLAB (INTRO) 2018/2019	15
Modelling and Optimisation of Energy Systems 2018/2019	17
Fuel Conversion and Production 2018/2019	19
Chemical Reactors and Process Systems 2018/2019	21
Optimisation Theory and Reliability 2018/2019	23
Optimisation, Analysis and Control of Thermal Energy and Processing Systems 2018/2019	25
Voluntary Traineeship 2018/2019	28
Master's Thesis 2018/2019	30
Master's Thesis 2018/2019	32
Modelling and Optimisation of Fuel Cell Systems 2018/2019	34
Optimisation, Analysis and Control of Fuel Cell and Hydrogen Technology Systems 2018/2019	36
Master's Thesis 2018/2019	39
Master's Thesis 2018/2019	41
Dynamics in Electrical Energy Engineering 2018/2019	43
Problem Based Project Organised Learning in Dynamics in Electrical Energy Engineering (INTRO) 2018/2019	46
Dynamic Modelling of Electrical Machines and Control Systems 2018/2019	48
High Voltage Engineering and EMI/EMC 2018/2019	50
Interaction between Wind Power Generation Units and Electrical Loads or Power System 2018/2019	52
Advanced Course in Electrical Power Systems 2018/2019	54
Advanced Power Electronics and Applications 2018/2019	56
Advanced Project in Wind Power Systems 2018/2019	58
Master's Thesis 2018/2019	61
Master's Thesis 2018/2019	63
Control of Power Electronic Systems 2018/2019	65
Control of Electrical Drive Systems and Converters 2018/2019	67
Advanced Project in Power Electronics and Drives 2018/2019	69
Master's Thesis 2018/2019	72
Master's Thesis 2018/2019	74
Control of a Hydraulically Actuated Mechanical Structure 2018/2019	76
Problem Based Problem Organised Learning in Control of a Hydraulically Actuated Mechanical Structure (INTRO) 2018/2019	79

Curriculum for the Master of Science (MSc) Programme in Energy Engineering 2017

Non-linear Control and Multi-body Systems 2018/2019	81
Advanced Control of Electrical Machines 2018/2019	83
Multi Variable Control 2018/2019	85
Mechatronic Systems 2018/2019	87
Master's Thesis 2018/2019	90
Master's Thesis in Mechatronic Control Engineering (long Master's Thesis) 2018/2019	92
Modern Electrical Power Systems Analysis 2018/2019	94
Advanced Project in Electrical Power Systems and High Voltage Systems 2018/2019	96
Master's Thesis 2018/2019	99
Master's Thesis 2018/2019	101
Advanced Analysis of Thermal Machines 2018/2019	103
Advanced Modelling and Control of Voltage Source Converters 2018/2019	105
Analysis of Advanced Thermal Process Systems 2018/2019	107
Battery Energy Storage Systems 2018/2019	109
Biomass Conversion and Biofuels 2018/2019	111
Biomass Gasification, Combustion and their Advanced Modelling 2018/2019	113
Control of Grid Connected Photovoltaic and Wind Turbine Systems 2018/2019	115
Electrochemical Modelling of Fuel Cells, Electrolysers and Batteries 2018/2019	117
Energy Conversion and Storage in Future Energy Systems 2018/2019	119
Fault Tolerant Control 2018/2019	121
Future Power System in Denmark 2018/2019	123
Modern Electrical Drives 2018/2019	125
Modern Power Electronic Devices and their Models 2018/2019	127
System Identification and Diagnosis 2018/2019	129
Test and Validation 2018/2019	131
Wind Power System and Renewable Energy Grid Integration 2018/2019	133

FLUID MECHANICAL ANALYSIS METHODS

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within analytical, numerical and experimental analysis methodology for fluid flow
- Have knowledge and comprehension within the flow around or within simplified components

SKILLS

- Be able to verify analytical and numerical approaches by means of simple laboratory experiments
- Be able to document the project work as a scientific paper and poster

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within fluid mechanical analysis methods
- Be able to define and analyse, in an independent manner, scientific problems within the area of fluid mechanical methods, and based on that make and state the reasons for decisions made

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project should be based upon a simple fluid flow problem. The problem should be investigated using analytical, numerical and experimental methods. The problem can be a process or a typical engineering component which involves single phase fluid flow of a stationary or a transient nature. The project should involve the Computational Fluid Dynamics (CFD) simulation of the simple fluid flow problem. The simulation should be verified by laboratory experiments and the validity of any assumptions made should be checked.

The purpose of the project may be:

- To analyse the performance of an engineering component
- To investigate the validity of empirical expressions or
- To conduct parameter variations on a design or similar

The project must be documented as described under "Additional Information".

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a precondition for students with a bachelor's degree from AAU that they participate in the Conference for MSc Energy Students (CES). Students are obliged to prepare a scientific paper and a poster which must be presented at the conference.

EXAMS

Name of exam	Fluid-Mechanical Analysis Methods
--------------	-----------------------------------

Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Examination format

The exam will be based on the documentation submitted and the rules in "Guidance for the Project of 1st Semester MSc in Sustainable Energy Engineering", see below.

This project module is common for students with a Bachelor's degree from Aalborg University heading for the specialisations in Thermal Energy and Process Engineering (TEPE), Fuel Cells and Hydrogen Technology (HYTEC) and Process Engineering and Combustion Technology (PECT).

Guidance for the Project of 1st Semester MSc in Energy Engineering (For students with a Bachelor's degree from Aalborg University) (not INTRO)

1. Demands to the project documentation

The project should fulfil the objectives of the 1st semester project theme and should be documented to an acceptable technical and scientific level. The documentation shall include a scientific paper and a poster, which shall fulfil the standard for an international conference, e.g. the IEEE specifications. Moreover, the documentation shall include a project summary report - see below.

2. Project documentation

The following material must be uploaded to the system "Digital Exam" on the date given for the submission:

- Scientific paper, max. 10 pages, which presents the primary content and results of the project work
- Project summary report (see below)
- Project poster

3. Conference participation

The paper must be presented, by one or more group members at a conference arranged within the Department of Energy Technology. The conference will be run in the same manner as an international conference. The project poster must also be presented at this conference. All group members must attend the conference and the poster session to be allowed to participate in the project examination.

4. Project summary report

The project summary report should elaborate the project details and conclusions. **The maximum length of the summary report (report without appendices) is 50 pages**, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed 30 + 15 × number of students in the project group.

5. Project exam

The project evaluation will take place at a later date than the conference.

At the project examination the project group shall present its project work in accordance to the Examination Policies and Procedures, Addendum to the Joint Programme Regulations

The presentation and assessment of the project is conducted in English.

FACTS ABOUT THE MODULE

Danish title	Fluidmekaniske analysemetoder
Module code	N-EE-K1-1
Module type	Project
Duration	1 semester
Semester	Autumn
ECTS	15
Language of instruction	English
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg, Campus Esbjerg
Responsible for the module	Henrik Sørensen

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

PROBLEM BASED PROJECT ORGANISED LEARNING IN THERMO-MECHANICAL ANALYSIS METHODS (INTRO)

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the problem based learning methods, as it is applied at Aalborg University
- Have knowledge and comprehension within the basis for both the analytical and especially the numerical analysis methodology for fluid flow and heat transmission, around or within simplified components or thermal process systems. These components or systems can be considered as integral parts of energy machinery or energy conversion systems

SKILLS

- Be able to verify, where relevant, the analytical and numerical approaches by means of simple laboratory experiments
- Be able to structure and plan PBL based project work and report writing
- Be able to communicate scientific results by means of a project report and an oral presentation in English

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within fluid-mechanical analysis methods
- Be able to define and analyse, in an independent manner, scientific problems within the area of fluid-mechanical methods, and based on that make and state the reasons for decisions made
- Be able to continue, in an independent manner, their own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. During the project period you should be able to plan and structure the project work, work in groups and solve conflicts, use consensus versus fight/voting and see differences among group members as a strength. You should also work with the structure of a project report and prepare a problem formulation, set up project limitation and time schedule. The project should contain a detailed analysis of a simple flow situation or combustion process. The analysis should include a numerical analysis which can be compared to relevant flow or combustion theory. The calculations should be verified by laboratory experiments. The validity of any assumptions made should be checked. The project should be based upon a problem which has its origins in thermal energy engineering. The problem should typically include a thermal energy conversion process and/or a fluid flow component.

EXTENT AND EXPECTED WORKLOAD

Since it is a 10 ECTS project module, the work load is expected to be 300 hours for the student

EXAM

EXAMS

Name of exam	Problem Based Project Organised Learning in Thermo-Mechanical Analysis Methods
--------------	--

Type of exam	Oral exam based on a project
ECTS	10
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Common for students with a Bachelor's degree from another university than Aalborg University heading for the specialisations in Thermal Energy and Process Engineering (TEPE) and Fuel Cells and Hydrogen Technology (HYTEC).

COMPUTATIONAL FLUID DYNAMICS (CFD) AND MULTIPHASE FLOW

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about the methods behind Computational Fluid Dynamics (CFD)
- Have knowledge about various spatial and temporal discretisation schemes
- Have knowledge about the pressure-velocity coupling method for solving the Navier-Stokes equations numerically
- Have knowledge about meshing strategies and boundary conditions
- Have knowledge about the fundamentals of turbulence, the energy cascade and Kolmogorov hypotheses
- Have knowledge and understanding within Reynolds-Averaged Navier-Stokes (RANS) and turbulence modelling
- Have knowledge about the fundamentals of multiphase flow
- Have knowledge about different modelling approaches for multiphase flow and multiphase models in the context of CFD
- Have knowledge about turbulence-particle interaction in multiphase flow

SKILLS

- Be able to use the finite volume method to numerically solve simple problems
- Be able to perform a mesh independency study in CFD analyses
- Be able to perform CFD analyses of a turbulent flow with regards to selection of turbulence model and near wall modelling/meshing strategy
- Be able to perform CFD analyses for non-reacting multiphase flow, for both the Euler-Euler and Euler-Lagrange approaches
- Be able to apply proper terminology in oral, written and graphical communication and documentation within CFD, turbulence and multiphase flows

COMPETENCES

- Be able to use the finite volume method to numerically solve simple problems
- Be able to perform a mesh independency study in CFD analyses
- Be able to perform CFD analyses of a turbulent flow with regards to selection of turbulence model and near wall modelling/meshing strategy
- Be able to perform CFD analyses for non-reacting multiphase flow, for both the Euler-Euler and Euler-Lagrange approaches
- Be able to apply proper terminology in oral, written and graphical communication and documentation within CFD, turbulence and multiphase flows

TYPE OF INSTRUCTION

Lectures supplemented by workshops, exercises, hands-on and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Computational Fluid Dynamics (CFD) and Multiphase Flow
Type of exam	Oral exam Oral examination which can be based on a mini-project.
ECTS	5
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

FLUID MECHANICS AND COMPRESSIBLE FLOW

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about fluid kinematics
- Have knowledge about stresses in fluids, equation of motion, constitutive models and Navier-Stokes equations
- Have knowledge about ideal fluids and potential flows, including application of potential theory to simple problems
- Have knowledge and comprehension within the fundamentals of gas dynamics and compressible flow
- Have knowledge about steady and unsteady shock wave phenomena in compressible flow
- Have knowledge about aerofoil performance in compressible flows

SKILLS

- Be able to describe assumptions and limitations of mathematical models for different types of flows
- Be able to apply appropriate analytical and semi-empirical models for mathematical description of fluid dynamic problems
- Be able to describe turbulent and laminar boundary layers including understanding of the momentum integral equation for boundary layers
- Be able to apply appropriate analytical and numerical method techniques to gas dynamics and compressible flows
- Be able to apply proper terminology in oral, written and graphical communication and documentation within fluid dynamics
- Be able to apply the topic of the module in multi-disciplinary contexts

COMPETENCES

- Be able to describe assumptions and limitations of mathematical models for different types of flows
- Be able to apply appropriate analytical and semi-empirical models for mathematical description of fluid dynamic problems
- Be able to describe turbulent and laminar boundary layers including understanding of the momentum integral equation for boundary layers
- Be able to apply appropriate analytical and numerical method techniques to gas dynamics and compressible flows
- Be able to apply proper terminology in oral, written and graphical communication and documentation within fluid dynamics
- Be able to apply the topic of the module in multi-disciplinary contexts

TYPE OF INSTRUCTION

Lectures supplemented by workshops, exercises, self-studies and study groups.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

PROBABILITY THEORY, STOCHASTIC PROCESSES AND APPLIED STATISTICS

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about fundamental concepts in probability, including conditional probability and independence
- Have knowledge about discrete and continuous random variables and relevant properties of these
- Have knowledge about various examples of descriptive statistics and graphics, e.g. histograms, boxplots, scatterplots, lag plots and auto covariance plots
- Have knowledge about statistical inference, including estimation, confidence intervals and hypothesis testing
- Have knowledge about basic concepts related to stochastic processes such as stationarity, correlation function and spectral density
- Have elementary knowledge about wiener processes, white noise and linear stochastic differential equations
- Have comprehension of a concrete example of a model for a simple stochastic process

SKILLS

- Be able, given specific data, to specify a relevant statistical model and account for the assumptions and limitations of the chosen model
- Be able to use relevant software for carrying out the statistical analysis of given data and be able to interpret the results of the analysis
- Be able to use statistical models, like linear regression (simple and multiple) and analysis of variance

COMPETENCES

- Be able to judge the applicability of statistics within own area
- Be capable of performing a critical evaluation of the results of a statistical analysis
- Be capable of communicating the results of a statistical analysis to people with no or little background within statistics.

TYPE OF INSTRUCTION

Lectures in combination with practical exercises and self-study or similar.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

Name of exam	Probability Theory, Stochastic Processes and Applied Statistics

CONTROL THEORY AND MATLAB (INTRO)

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Be able to comprehend time-domain analysis of continuous-time systems
- Be able to comprehend frequency response analysis of continuous-time systems
- Be able to apply the basic rules in discrete control theory including having knowledge about sampling systems, zero-order-hold and the influence of time delays
- Have knowledge and comprehension within the basic features of MATLAB as a programming language

SKILLS

- Be able to analyse and to design time-invariant linear continuous-time control systems using classical methods
- Be able to analyse different design and compensation methods in control engineering
- Be able to apply discrete equivalents for continuous transfer functions
- Be able to analyse, design and implement digital control systems
- Be able to use commercial simulation software as a control system design tool
- Be able to use the simple plotting facilities in MATLAB
- Be able to use data analysis routines in MATLAB

COMPETENCES

- Independently be able to define and analyse scientific problems

TYPE OF INSTRUCTION

The course will be taught by a mixture of lectures, workshops, exercises, mini-projects and self-study.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student

MODELLING AND OPTIMISATION OF ENERGY SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 1st semester on the Master of Science in Energy Engineering on one of the Thermal Energy Engineering specialisations or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Knowledge and comprehension and skills within synthesis of thermodynamic systems, their components and the interactions between these
- Knowledge about the design, modelling and optimisation of systems involving thermal equipment such as engines, gas-turbines, steam turbines in stand-alone or combined cycle configurations
- Knowledge about the conversion of plant-based biomass feedstocks and biological waste products to liquid fuels and the economic and strategic impact of the technologies involved
- Knowledge and comprehension within the thermodynamic aspects of processes involved in thermal and fuel conversion plants which involve phase change and both sub- and supercritical operation
- Knowledge and comprehension within the multiphase and chemical reaction based aspects involved in combustion processes and chemical process reactors

SKILLS

- Be able to judge the usefulness of the used different scientific methods for analysis and modelling of the energy systems
- Be able to verify the analytical and numerical approaches by means of experimental data
- Be able to select an appropriate optimisation procedure used for the energy systems and evaluate the optimisation results

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within energy systems
- Be able to independently define and analyse scientific problems in the area of modelling and optimisation of energy systems

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project should be based upon a thermal power plant or upon a fuel conversion process plant. The thermal plant could be a combined heat and power plant, a de-centralised power plant or a cooling plant. The plants should be simulated to achieve an optimum plant design in terms of overall plant economy. In the design of the plant analytical tools are to be applied, such as numerical optimisation, non-linear dynamical modelling or process integration. In addition the plant designed should be evaluated in relation to operational variations and/or the problems arising from start-up.

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM**EXAMS**

Name of exam	Modelling and Optimisation of Energy Systems
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale
Type of grading	External examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

FUEL CONVERSION AND PRODUCTION

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in Thermal and fluid dynamic systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about combustion technology
- Have an understanding of the kinetics involved in combustion processes
- Understand the topology of important catalytic conversion technologies
- Understand technologies involved in the production and processing of biomass and biofuels
- Have knowledge about chemical storage technologies

SKILLS

- Be able to perform calculations related to chemical combustion including kinetics
- Be able to design typical chemical conversion systems
- Be able to design systems involved in the production of biomass and biofuels
- Be able to design and evaluate chemical storage technologies

COMPETENCES

- Have the ability to apply and integrate the topics in an interdisciplinary correspondence with other related disciplines
- Be able to understand the assumptions of the fundamental design of chemical process and storage systems.

TYPE OF INSTRUCTION

Lectures supplied with independent studies and possibly guest lectures.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

Name of exam	Fuel Conversion and Production
Type of exam	Oral exam The exam can be based on mini projects and assignments solved during the course.

CHEMICAL REACTORS AND PROCESS SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in Thermal and fluid dynamic systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Be able to understand components and system configurations used in electrochemical and chemical conversion processes
- Understand the terminologies and notations used in fundamental electrochemical and chemical reactor analysis
- Have knowledge about applications of mass transfer used in relation to electrochemical and chemical reactors as well as processing systems
- Have knowledge about dynamic modelling of process systems

SKILLS

- Be able to design and model the fundamental classes of chemical reactors with one or multiple simultaneous reactions including heat transfer in steady and unsteady operation
- Be able to calculate chemical compositions arising from kinetically controlled electrochemical and chemical reactions
- Be able to calculate mass convection and diffusion and perform analysis on processes involving combined heat and mass transfer as well as mass transfer in porous materials and multicomponent mixtures
- Be able to develop fundamental dynamic models of the used components and overall process systems

COMPETENCES

- Have the ability to apply and integrate the topics in an interdisciplinary correspondence with other related disciplines
- Be able to understand the assumptions of the fundamental design chemical reactors and combined heat and mass transfer

TYPE OF INSTRUCTION

Lectures supplied with independent studies and possibly guest lectures.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

OPTIMISATION THEORY AND RELIABILITY

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in Probability Theory, Stochastic Processes and Applied Statistics on 1st semester of Master of Science study programme in Energy Engineering, Master of Science study programme in Sustainable Energy Engineering, or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have comprehension of the fundamental concepts, terms and methods used within optimisation
- Have comprehension of the fundamental concepts, terms and typical methods used within numerical optimisation of linear and nonlinear optimisation problems
- Have gained an in-depth understanding of important concepts and methods of optimisation for efficient solution of optimisation problems within different areas of engineering
- Have comprehension of how to apply reliability and robust design approach during product development
- Understand statistics that support robustness and reliability
- Have knowledge about cost of poor quality in a product lifetime
- Be able to establish mission profile for different applications and use it into the useful reliability context
- Understand difference between preventive scheduled maintenance or by degradation
- Have comprehension of stressor components like temperature, humidity, vibration and their impact
- Be able to model and determine life-time of components
- Understand physics of failure approach and also failure mechanism – both in normal operations and beyond
- Have knowledge about qualitative and quantitative test methods for reliability assessment
- Have knowledge about prognostic methods and real-time monitoring in power electronic systems

SKILLS

- Be able to use optimisation concepts and topics
- Be able to use numerical methods of unconstrained optimisation
- Be able to use numerical (mathematical programming) methods for optimisation of multidimensional functions with constraints
- Be able to solve multiobjective optimisation problems
- Be able understand how designs fit into the robustness validation concept
- Be able to set up simple methods for reliability targets and field analysis
- Be able to set up lifetime requirement at function level or component level
- Have knowledge of how to use test methods for reliability and robustness assessment

COMPETENCES

- Be able to account for the considerations involved in the process of formulating and solving engineering optimisation problems, choosing an advantageous method of solution and implementing it in practice.
- Be able to build a system reliability model
- Set up design limits in respect to reliability
- Be able to specify test procedures for new product development

TYPE OF INSTRUCTION

The form(s) of teaching will be determined and described in connection with the planning of the semester. The description will account for the form(s) of teaching and maybe accompanied by an elaboration of the roles of the participants. The programme is based on a combination of academic, problem oriented and interdisciplinary approaches and organised based on the following types of instruction that combine skills and reflection:

- lectures
- project work
- workshops
- exercises (individually and in groups)
- teacher feedback
- reflection
- portfolio work
- study circle
- self-study

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

Name of exam	Optimisation Theory and Reliability
Type of exam	Written exam
ECTS	5
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

FACTS ABOUT THE MODULE

Danish title	Optimeringsteori og pålidelighedsteori
Module code	N-EE-K2-13
Module type	Course
Duration	1 semester
Semester	Spring
ECTS	5
Language of instruction	English
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg, Campus Esbjerg
Responsible for the module	Henrik Clemmensen Pedersen , Huai Wang

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

OPTIMISATION, ANALYSIS AND CONTROL OF THERMAL ENERGY AND PROCESSING SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with specialisation in Thermal Energy and Process Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within how to design, optimise, control and analyse thermal energy and process engineering systems
- Have knowledge and comprehension within first principle analysis methods

SKILLS

- Be able to judge the usefulness of the used different scientific methods for the design, optimisation and control of thermal energy and process engineering systems
- Be able to establish and verify scientific hypotheses
- Be able to apply first principle analysis methods to complex thermo- or fluid-dynamical as well as chemical processing systems

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within optimisation, control, and analysis of thermal energy and process engineering systems
- Be able to show entrepreneurship to define and analyse scientific problems in the area of optimisation, control, and diagnostic analysis of thermal energy and process engineering systems, and based on that make and state the reasons for decisions made
- Be able to materialise innovative ideas within the area of optimisation, control, and analysis of thermal energy and process engineering systems
- Be able to independently continue own development in competence and specialisation
- Be able to follow more sophisticated literature, or state-of-the-art, within CFD, turbulent flow, thermal system optimisation and multiphase flow

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project work must be documented by a scientific paper (max. 8 pages) accompanied by a project summary report. The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed $30 + 15 \times \text{number of students in the project group}$. The scientific paper will be presented at a conference arranged within the Department of Energy Technology prior to the project examination. The project work should be based upon a thermal energy and process engineering system to which an optimisation, control or diagnostic system is to be set up. First, the system is to be modelled and different system identification methods can be applied to determine the parameters of the system. The system model is verified by simulations and data time series from either a real system or a laboratory set-up. Based on the model, the optimisation, control or diagnostic system is set up to improve the performance of the system, either with regard to power output, energy efficiency, life time extraction, fault detections etc. and the system should be implemented and verified experimentally. Due to special technical or scientific documentation requirements, the student documents the project work in a project report, which can be prepared

individually or in a group within the project theme; however the student's special preferences for the semester must be approved by the Study Board in advance.

EXTENT AND EXPECTED WORKLOAD

Since it is a 20 ECTS project module, the work load is expected to be 600 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a pre-condition that the student has submitted a scientific article and presented the scientific article at the CES conference prior to the project examination. All group members must be present at the conference

EXAMS

Name of exam	Optimisation, Analysis and Control of Thermal Energy and Processing Systems
Type of exam	Oral exam based on a project The project group should orally present the project work and scientific paper. The project group members will undergo an oral examination with internal adjudicator, based on the scientific paper and the project summary report.
ECTS	20
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 3rd semester Thermal Energy and Process Engineering.

The student may follow a relevant study as a guest student (30 ECTS) at another university in Denmark or abroad, see details in Moodle. However, the student's special preferences for the semester must be approved by the Study Board in advance.

FACTS ABOUT THE MODULE

Danish title	Optimering, analyse og regulering af termiske energi- og processystemer
Module code	N-EE-K3-1
Module type	Project
Duration	1 semester
Semester	Autumn
ECTS	20
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg
Responsible for the module	Chungen Yin

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

VOLUNTARY TRAINEESHIP

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the previous semesters on the Master of Science in Energy Engineering, the Master of Science in Sustainable Energy Engineering, or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about analytical, numerical and/or experimental methods for analysis of advanced tasks within the field of the external organisation
- Understand the connection between theory and practice
- Have knowledge about the organisational structure and the work of an organisation seen from an engineering/managerial perspective

SKILLS

- Be able to apply analytical, numerical and/or experimental methods for analysis and solving of advanced tasks within the field of the external organisation
- Be able to compare and evaluate assumptions, limitations and uncertainties related to the methods applied in connection to finding solutions of advanced challenges within the field of the external organisation

COMPETENCES

- Be able to handle development-oriented situations in connection to either studying or working
- Be able to use the correct terminology in oral, written or graphical communication and documentation of challenges and solutions within the field of the external organisation
- Be able to analyse the academic, professional and social benefits of the traineeship
- Be able to communicate these results in a project report and/or a case-based project report
- Be able to evaluate the learning result of the traineeship

TYPE OF INSTRUCTION

The student works in a company providing experience in solving advanced and relevant engineering tasks on a level corresponding to the study programme's 3rd semester and with a progression in the degree of difficulty of the tasks during the period. The type of work must allow for an academic report to be made. The student writes either a project report or a case-based project report within the theme of the 3rd semester of the specialisation, cf. "Guidelines for Project Work in an External Organisation (Voluntary Traineeship)" laid down by the School of Engineering and Science.

EXTENT AND EXPECTED WORKLOAD

Since it is a 30 ECTS project module, the work load is expected to be 900 hours for the student.

EXAM

EXAMS

Name of exam	Voluntary Traineeship
Type of exam	Oral exam based on a project

	An oral and individual examination based on either the project report or the case-based project report.
ECTS	30
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Instead of doing the project work and the elective courses, the student can do project work in a company as an individual or as a part of a group. See details in Moodle. However, the student's special preferences for the semester must be approved by the Study Board in advance.

FACTS ABOUT THE MODULE

Danish title	Projektorienteret forløb i en virksomhed

MASTER'S THESIS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 3rd semester on the Master of Science in Energy Engineering with specialisation in Thermal Energy and Process Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the area of thermal energy and process engineering at the highest international level
- Be able to critically judge knowledge and identify new scientific problems within the area of thermal energy and process engineering
- Have knowledge about the implications within the research work (research ethics)

SKILLS

- Be able to judge the usefulness of different scientific methods and tools for analysis and problem solving within the field of thermal energy and process engineering
- Be able to use advanced laboratory set-ups, data analysis methods and analysis and modelling methods within the field of thermal energy and process engineering
- Be able to communicate about scientific problems both to specialists and the public
- Have obtained skills related to the industrial area within thermal energy and process engineering

COMPETENCES

- Be able to control complex/unexpected working and development situations within thermal energy and process engineering, and be able to develop new solutions
- Be able to independently define and analyse scientific problems, and based on that make and state the reasons for decisions made
- Be able to independently continue own development in competence and specialisation
- Be able to independently be the head of professional and interdisciplinary development work and be able to undertake the professional responsibility including reporting

TYPE OF INSTRUCTION

Problem based project oriented project work. The final project may study new subjects or be an extension of the project work from previous semesters. The subject matter will remain in the area of thermal energy and process engineering. The project may be of theoretical or experimental nature and will often be in collaboration with an industrial company or other research institution performing research in the area of thermal energy and process engineering.

EXTENT AND EXPECTED WORKLOAD

Since it is a 30 ECTS project module, the work load is expected to be 900 hours for the student

EXAM**EXAMS**

Name of exam	Master's Thesis
Type of exam	Oral exam based on a project

MODELLING AND OPTIMISATION OF FUEL CELL SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 1st semester on the Master of Science in Energy Engineering on one of the Thermal Energy Engineering specialisations or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about the design, modelling and optimisation of energy systems used in various energy production applications involving fuel cell technology
- Have knowledge about and comprehension of the detailed operation, functionality and interaction between the various components used in fuel cell- and hydrogen production systems
- Have knowledge needed to construct and operate fuel cell based technologies in the laboratory and in real applications

SKILLS

- Be able to have analytical skills in system integration with respect to system efficiency and control aspects of fuel cell energy systems
- Be able to judge the usefulness of the used different scientific methods for analysis and modelling of fuel cell and hydrogen systems
- Be able to verify the analytical and numerical approaches by means of laboratory experiments
- Be able to evaluate the optimisation procedures used for fuel cell and hydrogen systems

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within fuel cell and hydrogen systems
- Be able to independently define and analyse scientific problems in the area of fuel cells and hydrogen systems

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The semester focuses on modelling and optimisation of a physical fuel cell or hydrogen based system. The semester project serves to give the students an advanced comprehension of systems based upon fuel cells and hydrogen technology. The fundamental competence within thermodynamics and control engineering within these systems are established. The students must develop a non-linear dynamical model of a system – for instance using block diagrams as in Simulink. Simultaneously, a data acquisition and control system is developed in for instance the Labview real time system through which basic analogical data acquisition and control is interconnected.

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM**EXAMS**

Name of exam	Modelling and Optimisation of Fuel Cell Systems
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale

DYNAMICS IN ELECTRICAL ENERGY ENGINEERING

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within dynamics in electrical energy engineering systems or apparatus
- Have knowledge and comprehension within modelling and simulation technologies required in accomplishing dynamic analysis

SKILLS

- Be able to analyse the dynamic behaviour of electrical energy systems or apparatus within the area of electrical power systems, electrical drive systems or in wind power systems
- Be able to make models and simulate such dynamic systems
- Be able to use methods for documenting the project work as a scientific paper and poster
- Be able to verify the models and the simulations by measurement in the laboratory or from existing data

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within the area of dynamics in electrical energy engineering
- Independently be able to define and analyse scientific problems within the area of dynamics in electrical energy engineering, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project is based on a problem where the dynamics of an electrical energy system or an electrical apparatus has to be analysed. The problem can be in the area of: • Electrical power systems • Electrical drive systems • Wind power systems where for instance short circuits, starting procedures, control issues etc. demands that the dynamics of the systems have to be taken into account. The system or apparatus is analysed and modelled and has to be simulated in an appropriate simulation tool. Verification of the models and the simulations are done by measurement in the laboratory or from existing data. The project must be documented as described in "Additional Information".

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a precondition for students with a bachelor's degree from AAU that they participate in the Conference for MSc Energy Students (CES). Students are obliged to prepare a scientific paper and a poster which must be presented at the conference.

EXAMS

Name of exam	Dynamics in Electrical Energy Engineering
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Common for students with a Bachelor's degree from Aalborg University heading for the specialisations in Electrical Power Systems and High Voltage Engineering (EPSH), Power Electronics and Drives (PED) and Wind Power Systems (WPS).

Guidance for the Project of 1st Semester MSc in Energy Engineering
(For students with a Bachelor's degree from Aalborg University) (not INTRO)

1. Demands to the project documentation

The project should fulfil the objectives of the 1st semester project theme and should be documented to an acceptable technical and scientific level. The documentation shall include a scientific paper and a poster, which shall fulfil the standard for an international conference, e.g. the IEEE specifications. Moreover, the documentation shall include a project summary report - see below.

2. Project documentation

The following material must be uploaded to the system "Digital Exam" on the date given for the submission:

- Scientific paper, max. 10 pages, which presents the primary content and results of the project work
- Project summary report (see below)
- Project poster

3. Conference participation

The paper must be presented, by one or more group members at a conference arranged within the Department of Energy Technology. The conference will be run in the same manner as an international conference. The project poster must also be presented at this conference. All group members must attend the conference and the poster session to be allowed to participate in the project examination.

4. Project summary report

The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed $30 + 15 \times \text{number of students in the project group}$.

5. Project exam

The project evaluation will take place at a later date than the conference.

At the project examination the project group shall present its project work in accordance to the Examination Policies and Procedures, Addendum to the Joint Programme Regulations

The presentation and assessment of the project is conducted in English.

FACTS ABOUT THE MODULE

Danish title	Dynamik i elektriske energisystemer
--------------	-------------------------------------

Module code	N-EE-K1-2
Module type	Project
Duration	1 semester
Semester	Autumn
ECTS	15
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg
Responsible for the module	Kaiyuan Lu

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

PROBLEM BASED PROJECT ORGANISED LEARNING IN DYNAMICS IN ELECTRICAL ENERGY ENGINEERING (INTRO)

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the Problem Based Learning methods, as it is applied at Aalborg University
- Have knowledge and analytical skills within project work in connection with problems in the areas of electrical energy engineering.
- Have knowledge and comprehension within dynamics in electrical energy engineering systems or apparatus

SKILLS

- Be able to analyse the dynamic behaviour of electrical energy systems or apparatus within the area of electrical power systems, electrical drive systems or in wind power systems
- Be able to make models and simulate such dynamic systems
- Be able to verify the models and the simulations by measurement in the laboratory or from existing data

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within the area of dynamics in electrical energy engineering
- Independently be able to define and analyse scientific problems within the area of dynamics in electrical energy engineering, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. During the project period you should be able to plan and structure the project work, work in groups and solve conflicts, use consensus versus fight/voting and see differences among group members as a strength. You should also work with the structure of a project report and prepare a problem formulation, set up project limitation and time schedule. The project is based on a problem where the dynamics of an electrical energy system or an electrical apparatus has to be analysed. The problem can be within the area of: • Electrical power systems • Electrical drive systems • Wind power systems where, for instance, short circuits, starting procedures, control issues etc. demand that the dynamics of the systems have to be taken into account. The system or apparatus is analysed and modelled and has to be simulated in an appropriate simulation tool. Verification of the models and the simulations are done by measurement in the laboratory or from existing data.

EXTENT AND EXPECTED WORKLOAD

Since it is a 10 ECTS project module, the work load is expected to be 300 hours for the student

EXAM

EXAMS

Name of exam	Problem Based Project Organised Learning in Dynamics in Electrical Energy Engineering
--------------	---

Type of exam	Oral exam based on a project
ECTS	10
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Common for students with a Bachelor's degree from another university than Aalborg University heading for the specialisations in Wind Power Systems, Power Electronics and Drives, and Electrical Power Systems and High Voltage Engineering.

FACTS ABOUT THE MODULE

Danish title	Problembaseret projektorganiseret læring i dynamik i elektriske energisystemer (INTRO)

DYNAMIC MODELLING OF ELECTRICAL MACHINES AND CONTROL SYSTEMS

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Be able to comprehend dynamic models of the transformer, the synchronous machine and the induction machine
- Have knowledge about the limitations for a dynamic model of an electrical machine
- Comprehend techniques for scalar variable-speed control of induction machines
- Have knowledge about implementation of controllers for variable-speed AC-drives
- Have knowledge about basic Finite Element Method for parameter estimation of dynamic systems

SKILLS

- Independently be able to define and analyse scientific problems involving a dynamic model of an electrical machine
- Be able to construct dynamic models for different electrical machines and implement them in simulation software
- Be able to analyse and design scalar controllers for electrical drives
- Be able to apply the Finite Element Method for determination of parameters used in dynamic models

COMPETENCES

- Independently be able to define and analyse scientific problems involving a dynamic model of an electrical machine
- Be able to construct dynamic models for different electrical machines and implement them in simulation software
- Be able to analyse and design scalar controllers for electrical drives
- Be able to apply the Finite Element Method for determination of parameters used in dynamic models

TYPE OF INSTRUCTION

The course will be taught by a mixture of lectures, workshops, exercises, mini-projects and self-study.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

HIGH VOLTAGE ENGINEERING AND EMI/EMC

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the following areas:
 - Fundamentals of high voltage engineering
 - Generation and measurement of High AC, DC and impulse voltages
 - Non-destructive test methods in high voltage engineering
 - Fundamental electrostatic field stress and dielectric breakdown
 - Gaseous discharges
 - Fundamentals of EMI/EMC
 - EMI/EMC problems in power electronic converters
 - Proper layout, layout guide
 - EMI/EMC models and solutions
 - EMI/EMC filters
 - EMI/EMC standards

SKILLS

- Be able to apply theories and laboratory experiments to describe generation and measurement of high AC, DC and impulse voltages for testing high voltage equipment
- Be able to apply theories and laboratory experiments to describe non-destructive test methods for evaluating the quality and lifetime of dielectrics
- Be able to apply theories and laboratory experiments to describe electric field stresses and gaseous discharges
- Be able to identify sources of EMI/EMC problems
- Be able to estimate and/or measure the EMI of a converter
- Be able to design filters

COMPETENCES

- Independently be able to define and analyse scientific problems within the area of power system high voltage engineering and EMI/EMC
- Independently be able communicate results from power system high voltage engineering and EMI/EMC
- Independently be able to be a part of professional and interdisciplinary development work within the field of power system high voltage engineering and EMI/EMC

TYPE OF INSTRUCTION

Lectures and laboratory experiments.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

INTERACTION BETWEEN WIND POWER GENERATION UNITS AND ELECTRICAL LOADS OR POWER SYSTEM

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 1st semester on the Master of Science in Energy Engineering on one of the Electrical Energy Engineering specialisations or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within how to set up demands/specifications for the interaction between wind power generator units and electrical loads or power system

SKILLS

- Be able to analyse the steady-state control and operation of wind power generation units connected to a system with time varying loads
- Be able to analyse the load flow in a system with wind generation
- Be able to analyse power system stability in a grid with high wind power penetration
- Be able to analyse the power quality aspects and identify the need and requirements for compensation units
- Be able to identify and develop appropriate models for wind power generation units including subsystems suitable for specific power systems studies
- Be able to assess wind power systems by means of simulation tools and/or laboratory experiments

COMPETENCES

- Be able to control the working and development process within the project theme
- Be able to identify specific technical requirements at system and subsystem level within the project theme
- Be able to independently identify and analyse technical and scientific problems related to the integration of wind power generation units in the electrical grid
- Be able to propose and select feasible solutions for solving specific challenges related to the grid integration of wind power
- Be able to independently continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The background of the project is a wind turbine system either a stand-alone or grid connected which has to be controlled under time varying loads and wind speed. Possible power quality and stability challenges are identified and formulated. The main components of the system are described and its requirements and specifications are given. The system is modelled and implemented using a simulation tool. The system is analysed with respect to power quality and stability. Methods, algorithms, devices for improving the power quality and stability of the entire system are proposed, developed and tested.

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM**EXAMS**

Name of exam	Interaction between Wind Power Generation Units and Electrical Loads or Power System
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale

ADVANCED COURSE IN ELECTRICAL POWER SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in power systems and power electronics or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

Students who complete the module will have knowledge about and ability to analyse more advanced topics within the area of power systems taking a starting point from today's state-of-the-art.

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about and comprehension of overvoltage protection and insulation coordination in power systems
- Have knowledge about and comprehension of power system protection
- Have comprehension of the mathematical tools and theories for harmonic distorted signals
- Have knowledge about the international standards for harmonics
- Have comprehension of large power system behaviour with respect to real and reactive power control
- Have comprehension of physical and mathematical modelling of large power systems for power system stability analysis
- Have comprehension of the types and methods for power system stability analysis and means of improving system stability
- Have knowledge about the need for reactive compensation at the distribution and transmission level
- Have knowledge about different reactive compensation methods
- Have knowledge about power system transients including switching transients and the parameter determination for the components involved in the three phase power system
- Have comprehension for the design and testing of external insulation

SKILLS

- Must be able to apply theories and laboratory experiments to analyse the above mentioned areas of modern power systems. The level of knowledge will meet today's state-of-the-art
- Must be able to analyse overvoltage protection systems and perform insulation coordination. This includes insulation strength and its characteristics, phase-ground switching overvoltages, the lightning flash and shielding of transmission lines
- Must be able to apply theories, models and simulation tools to analyse power system control and stability concepts
- Must be able to design power system protection using distance and differential protection
- Be able to analyse sources and effects of harmonic distortion
- Be able to analyse power system harmonic phenomena
- Be able to evaluate results by using measurements and instruments used for harmonic analysis
- Be able to apply numerical simulation tools for analysing power system transients

COMPETENCES

- Independently be able to define and analyse scientific problems within the area of advanced power system technology
- Independently be able to communicate results from advanced power system technology
- Independently be able to be a part of professional and interdisciplinary development work in advanced power system technology

TYPE OF INSTRUCTION

Lectures, exercises and laboratory experiments.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

ADVANCED POWER ELECTRONICS AND APPLICATIONS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in three phase inverters, control, machines and power systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

Have knowledge and comprehension within the following areas

- Magnetics scalability toward high power
 - - High power three phase transformers
 - - High power inductors
 - - Material properties
- High power devices
 - IGCT, GTO, Thyristor (Press-pack)
 - IGB T (package)
 - Emerging devices
 - Package properties
- High-power converters
 - Graetz bridge, Two level and three level (NPC)
 - Overview of other multilevel converter topology and basic control and applications.
 - Modular multilevel converters
 - High Voltage DC transmission and STATCOM
- High Power DC-DC converters
 - Soft switching, resonant
 - Converter topologies (practical aspects of design)

SKILLS

- Be able to compute the overall size and then system level ratings of the high power converters for different applications in power and renewable energy systems
- Be able to analyse the main components and requirements of high power converters
- Be able to evaluate the converter characteristics and design its high level controller
- Be able to analyse and evaluate the high power converter systems and evaluate their pros and cons for the given application
- Be able to evaluate the limitations and hence create the necessary design modifications (at system level) in high power converters

COMPETENCES

- Independently be able to define and analyse high power converter topologies and their specifications for the specific application in power and renewable energy systems
- Independently simulate the high power converter systems and communicate the results for system engineering

- Independently participate in the professional and interdisciplinary development work related with the application of high power converters in power and renewable energy systems

TYPE OF INSTRUCTION

Lecture followed by numerical and simulation exercises.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

ADVANCED PROJECT IN WIND POWER SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with specialisation in Wind Power Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension of how to design optimisation, control and/or diagnostic systems for wind turbines or wind power plants
- Have knowledge and comprehension within different advanced control methods
- Have knowledge and comprehension within different system identification and/or diagnostic methods

SKILLS

- Be able to judge the usefulness of the used different scientific methods for the design of optimisation, control, and/or diagnostic systems for wind turbines or wind farms
- Be able to verify the different scientific analysis and methods by means of laboratory experiments

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop feasible solutions within optimisation, control, and/or diagnostic of wind power systems
- Be able to show entrepreneurship to define and analyse scientific problems in the area of optimisation, control, and/or diagnostic of wind power systems, and based on that make and state the reasons for decisions made
- Be able to set up innovative ideas within the area of optimisation, control, and/or diagnostic of wind power systems
- Independently be able to continue own development in competence and specialisation
- Be able to follow more sophisticated literature, or state-of-the-art, within wind power systems or wind power plants

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project work must be documented by a scientific paper (max. 8 pages) accompanied by a project summary report. The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed $30 + 15 \times$ number of students in the project group. The scientific paper will be presented at a conference arranged within the Department of Energy Technology, prior to the project examination. The project should be based upon a wind turbine system or a wind power plant to which an optimisation, control and/or diagnostic system is to be set up. First, the system is to be modelled and different system identification methods can be applied to determine the parameters of the system. The system model is verified by simulations and data time series from either a real system or a laboratory set-up. Based on the model, the optimisation, control and/or diagnostic system is set up to improve the performance of the system, either with regard to power output, energy efficiency, life time extraction, fault detections etc. and the system should be implemented and verified. Due to special technical or scientific documentation requirements, the student documents the project work in a project report, which can be prepared individually or in a group within the project theme; however the student's special preferences for the semester must be approved by the Study Board in advance.

EXTENT AND EXPECTED WORKLOAD

Since it is a 20 ECTS project module, the work load is expected to be 600 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a pre-condition that the student has submitted a scientific article and presented the scientific article at the CES conference prior to the project examination. All group members must be present at the conference.

EXAMS

Name of exam	Advanced Project in Wind Power Systems
Type of exam	Oral exam based on a project The project group should orally present the project work and scientific paper as specified in the Examination Policies and Procedures, Addendum to the Joint Programme Regulations. The project group members will undergo an oral examination with internal adjudicator, based on the scientific paper and the project summary report.
ECTS	20
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 3rd Semester Wind Power Systems

The student may follow a relevant study as a guest student (30 ECTS) at another university in Denmark or abroad, see details in Moodle. However, the student's special preferences for the semester must be approved by the Study Board in advance.

FACTS ABOUT THE MODULE

Danish title	Avanceret projekt i vindmølleteknologi

MASTER'S THESIS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 3rd semester on the Master of Science in Energy Engineering with specialisation in Wind Power Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the area of wind power systems at the highest international level
- Be able to critically judge knowledge and identify new scientific problems within the area of wind power systems
- Have comprehension for the implications within the research work (research ethics)

SKILLS

- Be able to judge the usefulness of different scientific methods and tools for analysis and problem solving within the field of wind power systems
- Be able to use advanced laboratory set-ups, data analysis methods and analysis and modelling methods within the field of wind power systems
- Be able to communicate about scientific problems both to specialists and the public
- Have obtained skills related to the industrial area within wind power systems

COMPETENCES

- Be able to control complex/unexpected working and development situations within wind power systems, and be able to develop new solutions
- Independently be able to define and analyse scientific problems, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation
- Independently be able to be the head of professional and interdisciplinary development work and be able to undertake the professional responsibility

TYPE OF INSTRUCTION

Problem based project oriented project work. The final project may study new subjects or be an extension of the project work from previous semesters. The subject matter will remain in the area of wind power systems. The project may be of theoretical or experimental nature, and will often be in collaboration with an industrial company or other research institution performing research in the area of wind power systems.

EXTENT AND EXPECTED WORKLOAD

Since it is a 30 ECTS project module, the work load is expected to be 900 hours for the student

CONTROL OF POWER ELECTRONIC SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 1st semester on the Master of Science in Energy Engineering on one of the Electrical Energy Engineering specialisations or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Knowledge about modelling, analysing and simulating a system that must include a power electronic converter, a power source and an application typically an AC electric machine or an AC grid
- Comprehension of the practical implementation and test of the designed digital controller for the selected system

SKILLS

- Be able to apply a systematical design procedure for selection of a digital controller for the analysed system in order to meet certain performance requirements
- Be able to verify the analysis and models by means of laboratory experiments or by using real measured data series

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within control in power electronic systems
- Independently be able to define and analyse scientific problems in the area of control of power electronic systems, and based on that make and state the reasons for decisions made for instance with respect to their influences on the total system
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project must include a power electronic converter, a power source and an application, typically an AC electric machine or an AC grid. The operating principles for the system must be described and a control problem is formulated including key specifications. A dynamic simulation model is made taking the relevant dynamics into account. Different digital control methods are designed, analysed and evaluated by means of the simulation model. At least one method is selected for practical implementation in a real system incorporating a power electronic converter, a power source and a load, and a real-time digital control system based on a digital signal processor or a micro controller. The whole system is tested and the developed control strategies are evaluated.

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

CONTROL OF ELECTRICAL DRIVE SYSTEMS AND CONVERTERS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in Dynamic Modelling of Electrical Machines and Control Systems; Electrical Apparatus and Power Electronics; 1st semester project: Dynamics in Electrical Energy Engineering, or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about basic topologies for electrical drive systems
- Have knowledge about soft switching PWM-based circuits and resonant-based circuits in power electronic converters
- Have knowledge about how to control the basic topologies of converters for electrical drive systems
- Have comprehension of different control methods for electrical machines
- Have comprehension of advanced techniques for control of AC machines in high performance applications
- Have comprehension of different sensorless control methods

SKILLS

- Be capable of working with grid connected and autonomous electrical drive systems
- Be able to apply a suitable circuit topology for a given application
- Be capable of implementing different control methods for AC machines such as field oriented control and sensorless control

COMPETENCES

- Independently be able to define and analyse scientific problems within the area of control of electrical drive systems and converters
- Independently be able to communicate results from the area of control of electrical drive systems and converters
- Independently be able to be a part of professional and interdisciplinary development work in the area of control of electrical drive systems and converters

TYPE OF INSTRUCTION

The course will be taught by a mixture of lectures, workshops, exercises, mini-projects and self-study.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

ADVANCED PROJECT IN POWER ELECTRONICS AND DRIVES

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with specialisation in Power Electronics and Drives or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within how to design optimisation, control and/or diagnostic systems for power electronics drives or converters
- Have knowledge and comprehension within different advanced control methods and/or have knowledge and comprehension within different system identification and diagnostic methods

SKILLS

- Be able to judge the usefulness of the used different scientific methods for the design of optimisation, control and/or diagnostic systems for power electronic drives or converters
- Be able to verify the different scientific analysis and methods by means of laboratory experiments

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within optimisation, control and/or diagnostic of power electronic drives or converters
- Be able to show entrepreneurship to define and analyse scientific problems in the area of optimisation, control and/or diagnostic of power electronics drives or converters, and based on that make and state the reasons for decisions made
- Be able to set up innovative ideas within the area of optimisation, control and/or diagnostic of power electronic drives or converters
- Independently be able to continue own development in competence and specialisation
- Be able to follow more sophisticated literature, or state-of-the-art, within power electronics drives and converters

TYPE OF INSTRUCTION

Problem based problem oriented project work in groups. The project work must be documented by a scientific paper (max. 8 pages) accompanied by a project summary report. The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed $30 + 15 \times \text{number of students in the project group}$. The scientific paper will be presented at a conference arranged within the Department of Energy Technology, prior to the project examination. The project should be based upon a power electronic drive or converter to which an optimisation, control and/or diagnostic system is to be set up. First the system is to be modelled and different system identification methods can be applied to determine the parameters of the system. The system model is verified by simulations and data time series from either a real system or a laboratory set-up. Based on the model, the optimisation, control and/or diagnostic system is set up to improve the performance of the system, either with regard to power output, energy efficiency, life time extraction, fault detections etc. and the system should be implemented and verified experimentally. Due to special technical or scientific documentation requirements, the student documents the project work in a project report, which can be prepared individually or in a group within the project theme. However, the student's special preferences for the semester must be approved by the Study Board in advance.

EXTENT AND EXPECTED WORKLOAD

Since it is a 20 ECTS project module, the work load is expected to be 600 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a pre-condition that the student has submitted a scientific article and presented the scientific article at the CES conference prior to the project examination. All group members must be present at the conference.

EXAMS

Name of exam	Advanced Project in Power Electronics and Drives
Type of exam	Oral exam based on a project The project group should orally present the project work and scientific paper as specified in the Examination Policies and Procedures, Addendum to the Joint Programme Regulations. The project group members will undergo an oral examination with internal adjudicator, based on the scientific paper and the project summary report.
ECTS	20
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 3rd Semester Power Electronics and Drives.

The student may follow a relevant study as a guest student (30 ECTS) at another university in Denmark or abroad, see details in Moodle. However, the student's special preferences for the semester must be approved by the Study Board in advance.

FACTS ABOUT THE MODULE

Danish title	Avanceret projekt i effektelektronik og elektriske drivsystemer
Module code	N-EE-K3-4
Module type	Project
Duration	1 semester
Semester	Autumn
ECTS	20
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg
Responsible for the module	Kaiyuan Lu

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

MASTER'S THESIS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 3rd semester on the Master of Science in Energy Engineering specialisation in Power Electronics and Drives or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the area of power electronics and drives at the highest international level
- Be able to critically judge knowledge and identify new scientific problems within the area of power electronics and drives
- Have comprehension of the implications within the research work (research ethics)

SKILLS

- Be able to judge the usefulness of different scientific methods and tools for analysis and problem solving within the field of power electronics and drives
- Be able to use advanced laboratory set-ups, data analysis methods and analysis and modelling methods within the field of power electronics and drives
- Be able to communicate about scientific problems both to specialists and the public
- Have obtained skills related to the industrial area within power electronics and drives

COMPETENCES

- Be able to control complex/unexpected working and development situations within power electronics and drives, and be able to develop new solutions
- Independently be able to define and analyse scientific problems, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation
- Independently be able to be the head of professional and interdisciplinary development work and be able to undertake the professional responsibility

TYPE OF INSTRUCTION

Problem based project oriented project work. The final project may study new subjects or be an extension of the project work from previous semesters. The subject matter will remain in the area of power electronics and drives. The project may be of theoretical or experimental nature, and will often be in collaboration with an industrial company or other research institution performing research in the area of power electronics and drives.

EXTENT AND EXPECTED WORKLOAD

Since it is a 30 ECTS project module, the work load is expected to be 900 hours for the student

EXAM**EXAMS**

Name of exam	Master's Thesis
Type of exam	Oral exam based on a project
ECTS	30
Assessment	7-point grading scale

Faculty	Faculty of Engineering and Science

MASTER'S THESIS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying all previous semesters on the Master of Science in Energy Engineering specialisation in Power Electronics and Drives or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the area of power electronics and drives at the highest international level
- Be able to critically judge knowledge and identify new scientific problems within the area of power electronics and drives
- Have comprehension of the implications within the research work (research ethics)

SKILLS

- Be able to judge the usefulness of different scientific methods and tools for analysis and problem solving within the field of power electronics and drives
- Be able to use advanced laboratory set-ups, data analysis methods and analysis and modelling methods within the field of power electronics and drives
- Be able to communicate about scientific problems both to specialists and the public
- Have obtained skills related to the industrial area within power electronics and drives

COMPETENCES

- Be able to control complex/unexpected working and development situations within power electronics and drives, and be able to develop new solutions
- Independently be able to define and analyse scientific problems, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation
- Independently be able to be the head of professional and interdisciplinary development work and be able to undertake the professional responsibility

TYPE OF INSTRUCTION

Problem based project oriented project work. The final project may study new subjects or be an extension of the project work from previous semesters. The subject matter will remain in the area of power electronics and drives. The project may be of experimental nature, and will often be in collaboration with an industrial company or other research institution performing research in the area of power electronics and drives.

EXTENT AND EXPECTED WORKLOAD

Since it is a 50 ECTS project module, the work load is expected to be 1500 hours for the student

EXAM

EXAMS

Name of exam	Master's Thesis
Type of exam	Oral exam based on a project
ECTS	50
Assessment	7-point grading scale
Type of grading	External examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

The Master's Thesis is conducted as a long Master's Thesis using both the 3rd and 4th semesters. The long Master's Thesis must include experimental work and must be approved by the Study Board in advance. The amount of experimental work must reflect the allotted ECTS.

FACTS ABOUT THE MODULE

Danish title	Kandidatspeciale

CONTROL OF A HYDRAULICALLY ACTUATED MECHANICAL STRUCTURE

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about mechanical structures with complex dynamics and elements with non-linear behaviour.

SKILLS

- Be able to apply identification methods for determining system dynamics, when system information is not available
- Be able to apply the fundamental aspects of non-linear control theory and enable him/her to utilise the available system information to apply selected non-linear control methods on the considered system
- Be able to use methods for documenting the project work as a scientific paper and poster
- Be able to verify the models and the simulations by measurement in the laboratory or from existing data

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within the area of control of hydraulic actuated mechanical structures
- Independently be able to define and analyse scientific problems within the area of control of hydraulic actuated mechanical structures, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project takes its base in a hydraulically actuated mechanical system, which is to be controlled as a feed-back system. Models of both the mechanical structure and the actuation system are made and system identification methods should be used for critical parts where no component/system information is available. The models or critical parts hereof should be experimentally verified to show the validity of the models. Based on the developed models one or more selected non-linear control methods should be used to develop a control algorithm for the system, which should be implemented and verified experimentally and the results should be compared to what may be obtained with standard linear controllers. The project must be documented as described in "Additional Information".

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a precondition for students with a bachelor's degree from AAU that they participate in the Conference for MSc Energy Students (CES). Students are obliged to prepare a scientific paper and a poster which must be presented at the conference.

EXAMS

Name of exam	Control of a Hydraulically Actuated Mechanical Structure
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

For students with a Bachelor's degree from Aalborg University heading for the specialisation in Mechatronic Control Engineering.

Guidance for the Project of 1st Semester MSc in Energy Engineering
(For students with a Bachelor's degree from Aalborg University) (not INTRO)

1. Demands to the project documentation

The project should fulfil the objectives of the 1st semester project theme and should be documented to an acceptable technical and scientific level. The documentation shall include a scientific paper and a poster, which shall fulfil the standard for an international conference, e.g. the IEEE specifications. Moreover, the documentation shall include a project summary report - see below.

2. Project documentation

The following material must be uploaded to the system "Digital Exam" on the date given for the submission:

- Scientific paper, max. 10 pages, which presents the primary content and results of the project work
- Project summary report (see below)
- Project poster

3. Conference participation

The paper must be presented, by one or more group members at a conference arranged within the Department of Energy Technology. The conference will be run in the same manner as an international conference. The project poster must also be presented at this conference. All group members must attend the conference and the poster session to be allowed to participate in the project examination.

4. Project summary report

The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed 30 + 15 × number of students in the project group.

5. Project exam

The project evaluation will take place at a later date than the conference.

At the project examination the project group shall present its project work in accordance to the Examination Policies and Procedures, Addendum to the Joint Programme Regulations

The presentation and assessment of the project is conducted in English.

PROBLEM BASED PROBLEM ORGANISED LEARNING IN CONTROL OF A HYDRAULICALLY ACTUATED MECHANICAL STRUCTURE (INTRO)

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the Problem Based Learning methods, as it is applied at Aalborg University
- Have knowledge and analytical skills within project work in connection with problems in the areas of mechatronic control engineering
- Have knowledge about mechanical structures with complex dynamics and elements with non-linear behaviour

SKILLS

- Be able to apply identification methods for determining system dynamics, when system information is not available
- Be able to apply the fundamental aspects of non-linear control theory and enable him/her to utilise the available system information to apply selected non-linear control methods on the considered system
- Be able to verify the models and the simulations by measurement in the laboratory or from existing data

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within the area of control of hydraulic actuated mechanical structures
- Independently be able to define and analyse scientific problems within the area of control of hydraulic actuated mechanical structures, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. During the project period you should be able to plan and structure the project work, work in groups and solve conflicts, use consensus versus fight/voting and see differences among group members as a strength. You should also work with the structure of a project report and prepare a problem formulation, set up project limitation and time schedule. The project takes its base in a hydraulically actuated mechanical system, which is to be controlled as a feed-back system. Models of both the mechanical structure and the actuation system are made and system identification methods should be used for critical parts where no component/system information is available. The models or critical parts hereof should be experimentally verified to show the validity of the models. Based on the developed models one or more selected non-linear control methods should be used to develop a control algorithm for the system, which should be implemented and verified experimentally and the results should be compared to what may be obtained with standard linear controllers.

EXTENT AND EXPECTED WORKLOAD

Since it is a 10 ECTS project module, the work load is expected to be 300 hours for the student

EXAM

EXAMS

Name of exam	Problem Based Problem Organised Learning in Control of a Hydraulically Actuated Mechanical Structure
Type of exam	Oral exam based on a project
ECTS	10
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

For students with a Bachelor's degree from another university than Aalborg University heading for the specialisation in Mechatronic Control Engineering.

NON-LINEAR CONTROL AND MULTI-BODY SYSTEMS

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Be able to carry out kinematic analysis of multi-body systems
- Be able to model multi-body dynamical systems using selected methods
- Be able to develop complete system models that include actuators and possible hard non-linearities
- Be able to analyse systems using linearization-, Lyapunov- and phase plane methods
- Be able to design non-linear controllers for considered systems in the presence on uncertain and possibly varying system parameters

SKILLS

- Be able to establish various types models for non-linear system, including multi-body and actuator models
- Be able to judge the usefulness of the different analyses and design methods
- Be able to apply the learned knowledge to analyse and study non-linear dynamical systems
- Be able to design selected types of non-linear controllers
- Be able to implement selected types of non-linear controllers

COMPETENCES

- Independently be able to describe and analyse non-linear systems
- Independently be able to design considered non-linear controllers
- Independently be able to continue own development within the field of non-linear systems analysis and control

TYPE OF INSTRUCTION

The programme is based on a combination of academic, problem oriented and interdisciplinary approaches and organised based on the following types of instruction that combine skills and reflection: - lectures - class teaching - project work - workshops - exercises (individually and in groups) - teacher feedback - professional reflection - portfolio work - laboratory Work The form(s) of teaching will be determined and described in connection with the planning of the semester. The description will account for the form(s) of teaching and may be accompanied by an elaboration of the roles of the participants.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

Name of exam	Non-linear Control and Multi-body Systems
Type of exam	Written or oral exam
ECTS	5
Assessment	7-point grading scale
Type of grading	Internal examination

Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/
------------------------	--

ADDITIONAL INFORMATION

This course is taught to the 1st semester MSc students at the Mechatronic Control Engineering specialisation and is offered as an elective course at the 3rd semester of all other specialisations. Students of the Mechatronic Control Engineering specialisation cannot elect the module again.

FACTS ABOUT THE MODULE

Danish title	Ikke-lineær regulering og flerlegeme systemer
Module code	N-EE-K1-11
Module type	Course
Duration	1 semester
Semester	Autumn
ECTS	5

ADVANCED CONTROL OF ELECTRICAL MACHINES

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 1st semester on the Master of Science in Energy Engineering on the Mechatronic Control Engineering specialisation or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about and understanding of the operating principles of an energy transmission system comprising a power electronic converter feeding an electric actuator
- Be able to analyse such a system and be able to set up dynamic system models
- Have comprehensive knowledge about practical application of feedback control theory for such a system

SKILLS

- Be able to apply appropriate methods and tools for analysis of power electronic converters
- Be able to design modulators for power electronic converters and be able to design control systems for an electrical actuator fed from a power electronic converter
- Be able to verify the analysis, models and the design by means of laboratory experiments

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to analyse and develop a control system for an electric actuator fed by a power electronics converter
- Independently be able to define and analyse scientific problems in the said area
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project takes its base in an electric actuator that is used to drive a mechanical load. The actuator may be a poly-phase AC machine or another kind of electro-mechanical device. The actuator must be fed from a hard or soft-switched power electronic converter and closed-loop control principles must be adopted. The whole power transmission system must be analysed. Selected parts of the system may be developed and realized in the project. This may also include development of a power electronic converter, a digital control system or interfacing circuitry. Requirements to control strategies for the converter and the actuator must be formulated. Suitable modulation methods and controllers must be analysed, designed, simulated and evaluated. Laboratory implementation and tests of the whole system or selected parts of it must be conducted and evaluated.

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM**EXAMS**

Name of exam	Advanced Control of Electrical Machines
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale
Type of grading	External examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 2nd semester Mechatronic Control Engineering.

MULTI VARIABLE CONTROL

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved in classical control theory and state space control.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have gained an in-depth understanding of basic aspects of multivariable control design, the approaches, the key quantities to consider and the fundamental limitations inherent in the design
- Be able to, on a scientific basis, to understand and apply advanced model based control design tools
- Be able to document understanding of multivariable systems (multiple inputs and multiple outputs MIMO)

SKILLS

- Be able to understand the fundamental performance limitations of single input and single output (SISO) systems
- Be able to represent linear systems in different ways: Transfer functions matrices, input-output equations, state space form, etc.
- Be able to understand what disturbances are, and to describe their character in a suitable way
- Be able to set up design specifications for MIMO systems
- Be able to understand basic limitations in control design
- Be able to set up the configuration of multivariable controllers
- Be able to design linear multivariable controllers

COMPETENCES

- Be able to undertake analysis, design and implementation of advanced multivariable control systems where experience and intuition play a very important role

TYPE OF INSTRUCTION

The form(s) of teaching will be determined and described in connection with the planning of the semester. The description will account for the form(s) of teaching and maybe accompanied by an elaboration of the roles of the participants. The programme is based on a combination of academic, problem oriented and interdisciplinary approaches and organised based on the following types of instruction that combine skills and reflection: - lectures - project work - workshops - exercises (individually and in groups) - teacher feedback - reflection - portfolio work - study circle - self-study

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

MECHATRONIC SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with specialisation in Mechatronic Control Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about and comprehension of how to optimize mechatronic systems
- Have knowledge about and comprehension of how to design control and/or diagnostic systems for mechatronic systems
- Have knowledge and comprehension within different system identification and/or diagnostic methods

SKILLS

- Be able to judge the usefulness of the used different scientific methods for the design of control and/or diagnostic systems for mechatronic systems
- Be able to judge the usefulness of different optimisation algorithms for doing optimisation of a mechatronic system
- Be able to verify the different scientific analysis and evaluate the methods used by means of laboratory experiments

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions using optimisation to design mechatronic systems and incorporate control and diagnostics systems
- Be able to show entrepreneurship to define and analyse scientific problems in the area of optimisation, control and/or diagnostic of mechatronic systems, and based on that make and state the reasons for decisions made
- Be able to set up innovative ideas within the area of optimisation, control, and/or diagnostic of mechatronic systems
- Independently be able to continue own development in competence and specialisation
- Be able to follow more sophisticated literature, or state-of-the-art, within advanced mechatronic control systems

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project work must be documented by a scientific paper (max. 8 pages) accompanied by a project summary report. The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed $30 + 15 \times$ number of students in the project group. The scientific paper will be presented at a conference arranged within the Department of Energy Technology, prior to the project examination. The project should be based upon a mechatronic system to which an optimisation, control and/or diagnostic system is to be set up. First the system is to be modelled and different system identification methods can be applied to determine the parameters of the system. The system model is verified by simulations and data time series from either a real system or a laboratory set-up. Based on the model, the optimisation, control and/or diagnostic system is set up to improve the performance of the system, either with regard to power output, energy efficiency, life time extraction, fault detections etc. and the system should be implemented and verified experimentally. Due to special technical or scientific documentation requirements, the student documents the project work in a project report, which can be prepared individually or in a group within the project theme; however the student's special preferences for the semester must be approved by the Study Board in advance.

EXTENT AND EXPECTED WORKLOAD

Since it is a 20 ECTS project module, the work load is expected to be 600 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a pre-condition that the student has submitted a scientific article and presented the scientific article at the CES conference prior to the project examination. All group members must be present at the conference.

EXAMS

Name of exam	Mechatronic Systems
Type of exam	Oral exam based on a project The project group should orally present the project work and scientific paper as specified in the Examination Policies and Procedures, Addendum to the Joint Programme Regulations. The project group members will undergo an oral examination with internal adjudicator, based on the scientific paper and the project summary report.
ECTS	20
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 3rd Semester Mechatronic Control Engineering.

The student may follow a relevant study as a guest student (30 ECTS) at another university in Denmark or abroad, see details in Moodle. However, the student's special preferences for the semester must be approved by the Study Board in advance.

MASTER'S THESIS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 3rd semester on the Master of Science in Energy Engineering with specialisation in Mechatronic Control Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the area of mechatronic control engineering at the highest international level
- Be able to critically judge knowledge and identify new scientific problems within the area of mechatronic control engineering
- Have comprehension of the implications within the research work (research ethics)

SKILLS

- Be able to judge the usefulness of different scientific methods and tools for analysis and problem solving within the field of mechatronic control engineering
- Be able to use advanced laboratory set-ups, data analysis methods and analysis and modelling methods within the field of mechatronic control engineering
- Be able to communicate about scientific problems both to specialists and the public
- Have obtained skills related to the industrial area within mechatronic control engineering

COMPETENCES

- Be able to control complex/unexpected working and development situations within mechatronic control engineering, and be able to develop new solutions
- Independently be able to define and analyse scientific problems, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation
- Independently be able to be the head of professional and interdisciplinary development work and be able to undertake the professional responsibility

TYPE OF INSTRUCTION

Problem based project oriented project work. The final project may study new subjects or be an extension of the project work from previous semesters. The subject matter will remain in the area of mechatronic control engineering. The project may be of theoretical or experimental nature, and will often be in collaboration with an industrial company or other research institution performing research in the area of mechatronic control engineering.

EXTENT AND EXPECTED WORKLOAD

Since it is a 30 ECTS project module, the work load is expected to be 900 hours for the student

EXAM**EXAMS**

Name of exam	Master's Thesis
Type of exam	Oral exam based on a project
ECTS	30
Assessment	7-point grading scale
Type of grading	External examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

FACTS ABOUT THE MODULE

Danish title	Kandidatspeciale
Module code	N-EE-K4-6
Module type	Project
Duration	1 semester
Semester	Spring
ECTS	30
Language of instruction	English
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg
Responsible for the module	Henrik Clemmensen Pedersen
Time allocation for external examiners	D

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

MASTER'S THESIS IN MECHATRONIC CONTROL ENGINEERING (LONG MASTER'S THESIS)

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying previous semesters on the Master of Science in Energy Engineering with specialisation in Mechatronic Control Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within the area of mechatronic control engineering at the highest international level
- Be able to critical judge knowledge and identify new scientific problems within the area of mechatronic control engineering
- Have comprehension of the implications within the research work (research ethics)

SKILLS

- Be able to judge the usefulness of different scientific methods and tools for analysis and problem solving within the field of mechatronic control engineering
- Be able to use advanced laboratory set-ups, data analysis methods and analysis and modelling methods within the field of mechatronic control engineering
- Be able to communicate about scientific problems both to specialists and the public
- Have obtained skills related to the industrial area within mechatronic control engineering

COMPETENCES

- Be able to control complex/unexpected working and development situations within mechatronic control engineering, and be able to develop new solutions
- Independently be able to define and analyse scientific problems, and based on that make and state the reasons for decisions made
- Independently be able to continue own development in competence and specialisation
- Independently be able to be the head of professional and interdisciplinary development work and be able to undertake the professional responsibility

TYPE OF INSTRUCTION

Problem based project oriented project work. The final project may study new subjects or be an extension of the project work from previous semesters. The subject matter will remain in the area of mechatronic control engineering. The project may be of experimental nature, and will often be in collaboration with an industrial company or other research institution performing research in the area of mechatronic control engineering.

EXTENT AND EXPECTED WORKLOAD

Since it is a 50 ECTS project module, the work load is expected to be 1500 hours for the student

EXAM

EXAMS

Name of exam	Master's Thesis in Mechatronic Control Engineering (long Master's Thesis)
Type of exam	Oral exam based on a project
ECTS	50
Assessment	7-point grading scale
Type of grading	External examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

The Master's Thesis is conducted as a long Master's Thesis using both the 3rd and 4th semesters. The long Master's Thesis must include experimental work and must be approved by the Study Board in advance. The amount of experimental work must reflect the allotted ECTS.

FACTS ABOUT THE MODULE

Danish title	Kandidatspeciale mekatronisk regulerings teknik (langt afgangprojekt)
Module code	N-EE-K4-6LNG
Module type	Project
Duration	2 semesters
Semester	Autumn
ECTS	50
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg
Responsible for the module	Henrik Clemmensen Pedersen
Time allocation for external examiners	D

ORGANISATION

Study Board	Study Board of Energy
Department	Department of Energy Technology
Faculty	Faculty of Engineering and Science

MODERN ELECTRICAL POWER SYSTEMS ANALYSIS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 1st semester on the Master of Science in Energy Engineering on one of the Electrical Energy Engineering specialisations or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Knowledge about implementation and test of methodologies and techniques in modern power system analysis

SKILLS

- Be able to apply methods for synthesizing the design and simulation of control and active grid management of modern electrical power systems
- Be able to apply load flow and harmonic flow calculations in distribution and transmission systems
- Be able to conduct short circuit studies and analyse relay protection systems for modern power systems
- Be able to perform electromagnetic transient analysis of different phenomena in modern power systems
- Be able to understand and analyse the grid impact of distributed energy resources and other techno-economic system challenges in the design, control and management of modern electrical power systems
- Be able to apply the basics of load estimation, power system economics, demand side management techniques for operation and control of modern power systems
- Be able to verify the analysis and models by means of laboratory experiments or by using real measured data series

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within modern electrical power system analysis with adequate focus on economic and environmental-friendly technologies
- Independently be able to define and analyse scientific problems in the area of control and active network management of modern power systems, and based on that make and state the reasons for decisions made for instance with respect to their influences on the total system
- Independently be able to continue own development in competence and specialisation

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The background of the project is an electrical power system which has to be controlled and/or supervised (digital simulators and instrumentation systems). The system is to be described and a specification is to be made. The system should be modelled and implemented in a simulation program. Different control and/or active network management methods are to be simulated, analysed and evaluated with the purpose of selecting a solution. A complete system (or parts) should be designed and implemented as a real-time system in the laboratory or real time data should be achieved from an existing system. The implemented system and the designed control and/or active network management strategies should be tested, verified and evaluated based on the set-up in the laboratory or by real life data.

EXTENT AND EXPECTED WORKLOAD

Since it is a 15 ECTS project module, the work load is expected to be 450 hours for the student

EXAM**EXAMS**

Name of exam	Modern Electrical Power Systems Analysis
Type of exam	Oral exam based on a project
ECTS	15
Assessment	7-point grading scale
Type of grading	External examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 2nd Semester Electrical Power Systems and High Voltage Engineering.

FACTS ABOUT THE MODULE

Danish title	Analyse af moderne elektriske fordelingsanlæg
Module code	N-EE-K2-5
Module type	Project
Duration	1 semester
Semester	Spring
ECTS	15
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg
Responsible for the module	Filipe Miguel Faria da Silva
Time allocation for external examiners	B

ORGANISATION

Study Board	Study Board of Energy

Faculty	Faculty of Engineering and Science

ADVANCED PROJECT IN ELECTRICAL POWER SYSTEMS AND HIGH VOLTAGE SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with specialisation in Electrical Power Systems and High Voltage Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about and comprehension of how to design, optimise, operate and/or diagnose electrical power systems or high voltage systems
- Have knowledge and comprehension within different advanced optimisation methods and apply the mathematical concepts to electrical power systems or high voltage systems and/or have knowledge and comprehension within different system identification and diagnostic methods and their application
- Have knowledge and comprehension of how electric power systems are operated in different scenarios (steady-state, alert and/or emergency operation, during transients)

SKILLS

- Be able to judge the usefulness of the used different scientific methods for the design, optimisation, optimisation control and/or diagnostic of electric power systems or high voltage systems
- Be able to verify the different scientific analysis and methods by means of laboratory experiments and/or advance computer simulations

COMPETENCES

- Be able to control the working and development process within the project theme, and be able to develop new solutions within design, optimisation, operation and/or diagnostic of electrical power systems or high voltage systems
- Be able to show entrepreneurship to define and analyse scientific problems in the area of design, optimisation, operation and/or diagnostic of electrical power systems or high voltage systems, and based on that make and state the reasons for decisions made
- Be able to set up innovative ideas within the area of design, optimisation, operation and/or diagnostic of electrical power systems or high voltage systems
- Independently be able to continue own development in competence and specialisation
- Be able to follow more sophisticated literature, or state-of-the-art, within electrical power systems and high voltage systems

TYPE OF INSTRUCTION

Problem based project oriented project work in groups. The project work must be documented by a scientific paper (max. 8 pages) accompanied by a project summary report. The project summary report should elaborate the project details and conclusions. The maximum length of the summary report (report without appendices) is 50 pages, and in addition the summary report should follow the rules as laid down by the Study Board in "Procedure for Project Work", i.e. the total number of pages must not exceed $30 + 15 \times$ number of students in the project group. The scientific paper will be presented at a conference arranged within the Department of Energy Technology, prior to the project examination. The project should be based upon an electrical power system or a high voltage system to which an optimisation, control and/or diagnostic system is to be set up. First, the system is to be modelled and different system identification methods can be applied to determine the parameters of the system. The system model is verified by simulations and data time series from either a real system or a laboratory set-up. Based on the model, the optimisation, control and/or diagnostic

system is set up to improve the performance of the system, either with regard to power output, energy efficiency, life time extraction, fault detections etc. and the system should be implemented and verified experimentally. Due to special technical or scientific documentation requirements, the student documents the project work in a project report, which can be prepared individually or in a group within the project theme; however the student's special preferences for the semester must be approved by the Study Board in advance.

EXTENT AND EXPECTED WORKLOAD

Since it is a 20 ECTS project module, the work load is expected to be 600 hours for the student

EXAM

PREREQUISITE FOR ENROLLMENT FOR THE EXAM

- It is a pre-condition that the student has submitted a scientific article and presented the scientific article at the CES conference prior to the project examination. All group members must be present at the conference.

EXAMS

Name of exam	Advanced Project in Electrical Power Systems and High Voltage Systems
Type of exam	Oral exam based on a project The project group should orally present the project work and scientific paper as specified in the Examination Policies and Procedures, Addendum to the Joint Programme Regulations. The project group members will undergo an oral examination with internal adjudicator, based on the scientific paper and the project summary report.
ECTS	20
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ADDITIONAL INFORMATION

Project on 3rd Semester Electrical Power Systems and High Voltage Engineering.

The student may follow a relevant study as a guest student (30 ECTS) at another university in Denmark or abroad, see details in Moodle. However, the student's special preferences for the semester must be approved by the Study Board in advance.

FACTS ABOUT THE MODULE

Danish title	Avanceret projekt i elektriske anlæg og højspændingssystemer

ADVANCED ANALYSIS OF THERMAL MACHINES

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with a thermal specialisation, Master of Science in Sustainable Energy Engineering with specialisation in Process Engineering and Combustion Technology or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Conversion between different forms of energy
- Design of thermal machines
- Performance characteristics of thermal machines
- Behaviour of in- and outflow conditions for thermal machines
- Advanced analytical, numerical and/or experimental analysis of thermal machines
- Energy, momentum and heat exchange in thermal machines
- Phase change and multi-phase characteristics of thermal machines

SKILLS

- Be able to select and apply appropriate methods for performance analysis of thermal machines
- Be able to apply multi physics modelling in the analysis of thermal machines and components
- Be able to select and apply appropriate equipment for monitoring and performance measurements on thermal machines

COMPETENCES

- Independently be able to simulate thermal machines in design and off-design operation
- Independently be able to evaluate the performance of thermal machines in a given application or system
- Independently be able to evaluate the effect of design changes in thermal machines
- Independently be able to continue the development of own competences in the field of thermal machines

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, lab exercises, and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

Name of exam	Advanced Analysis of Thermal Machines
Type of exam	Written and oral exam Oral examination based on a handed-in mini-project/test report (individual or in groups).

ADVANCED MODELLING AND CONTROL OF VOLTAGE SOURCE CONVERTERS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Offshore Energy Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about average and small-signal models for voltage Source Converter (VSC) circuits including pulse-width modulators and different output filters
- Understand impedance-based approach to get an insightful yet easy-to-implement way for controller design and stability assessment of VSCs
- Understand impedance-based stability analysis of grid synchronisation and outer DC link voltage control loops
- Understand equivalence and differences between models represented by single-input single-output complex transfer functions and multi-input multi-output transfer matrices
- Have knowledge about passivity-based stability analysis and control for robustly stable VSCs with different grid conditions
- Have knowledge about virtual-impedance-based control for active stabilisation and harmonic compensation of VSCs

SKILLS

- Be able to develop small-signal models for the closed-loop-controlled VSC with closed correlations with time-domain simulations
- Be able to design current controller, phase-locked loop, and DC link voltage controllers under given dynamic specifications
- Be able to identify the causes of the different instability phenomena of grid-connected VSCs
- Be able to design and implement different active damping controllers for stabilizing VSCs

COMPETENCES

- Be able to deal with the instability problems in the emerging VSCs-based power systems, which are nowadays commonly found in renewable power plants, electric transportation systems, and flexible ac/dc transmission/distribution systems

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises in simulations (PLECS) and experiments (dSPACE 1007). Guest lectures relevant to the course will also be involved.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Advanced Modelling and Control of Voltage Source Converters
Type of exam	Written and oral exam Students should do a mini project and submit the report in groups, and then an oral examination will be held.

ANALYSIS OF ADVANCED THERMAL PROCESS SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with a thermal specialisation or Master of Science in Sustainable Energy Engineering with a specialisation in Process Engineering and Combustion Technology or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have comprehension of the aspects of integration and analysis of advanced thermal processes regarding, for example:
 - Analysis and optimisation of thermal systems using techniques such as pinch analysis and heat exchanger network synthesis using mathematical programming techniques
 - Case: Modelling of part-load conditions in thermal systems including practical control aspects
 - Case: Modelling and integration of advanced fuel cell systems
- Have knowledge about advanced fluid dynamical topics and system analysis of such systems related, for example:
 - Techniques involved in the design of heat/mass exchangers – shell-and-tube, plate, extended surface, evaporators, condensers, humidifiers, etc. Flow induced vibrations
 - Two-phase fluid flow, models, boiling, condensation and instabilities
 - Equations of State. Thermodynamic functions/properties. Maxwell's relations. Residual properties. Phase equilibrium and phase change
 - Heat transfer by radiation. Modelling methods (e.g. Discrete Ordinate, Discrete Transfer, Monte-Carlo, etc). Gaseous radiative properties. CFD modelling of radiative heat transfer

SKILLS

- Be able to identify the elements related to the control aspects of thermal systems
- Be able to apply the knowledge gained to set up experiments on advanced fluid dynamical systems
- Be able to apply the knowledge on advanced fluid dynamical systems related to the above topics

COMPETENCES

- Independently be able to define and analyse scientific problems within the area of advanced thermal process systems and advanced fluid dynamical systems
- Independently be able to be a part of professional and interdisciplinary development work within the area of thermal process systems and advanced fluid dynamical systems

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises, mini-projects and self-study.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

BATTERY ENERGY STORAGE SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical or thermal specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Offshore Energy Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about different battery energy storage technologies (e.g. lithium-ion, lead acid etc.) and understand their operation principles
- Understand the operation/role of energy storage devices and their suitability for different applications (e.g., grid services, electrical vehicles etc.)
- Have good knowledge about the performance (static and dynamic) behaviour of batteries and its dependence on the operating conditions (temperature, load current etc.). Gain experience about different performance and thermal modelling approaches and model parameterization techniques.
- Understand the degradation process of lithium-ion and lead-acid batteries from a macroscopic perspective. Gain knowledge about different methods for lifetime estimation of batteries.
- Gain practical knowledge about testing of lead-acid and lithium-ion batteries in laboratory

SKILLS

- Be able to evaluate the suitability of different energy storage technologies for various applications
- Be able to test different battery technologies in laboratory and to measure their most important electrical and thermal parameters
- Be able to derive various battery parameters from laboratory measurements

COMPETENCES

- Be able to develop performance models for different battery technologies based on various requirements
- Independently be able to develop procedures for laboratory testing of batteries

TYPE OF INSTRUCTION

The course will be planned and organised in close interaction with on-going research and development activities at the Department of Energy Technology and its collaborators. All modules include exercises focusing on the presented material; some exercises will be performed using MATLAB and Simulink. Moreover, some exercises will be carried out on programmable battery test stations.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

BIOMASS CONVERSION AND BIOFUELS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with a thermal specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Process Engineering and Combustion Technology or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Biomass resource quantification
- Thermo-chemical and bio-chemical conversion pathways
- Biorefinery concepts

SKILLS

- Be able to assess suitable conversion routes for specific biomasses
- Be able to carry out chemical analysis of fuels to assess their properties
- Be able to analyse and evaluate processes of biomass conversion to fuel or energy
- Be able to evaluate the sustainability of biofuels from different biomass resources using a life cycle perspective with focus on greenhouse gas emissions
- Be able to apply process modelling methods to biorefinery concepts

COMPETENCES

- Independently be able to assess biomass resources dedicated for bioenergy production and to design systems of biomass conversion, i.e. biorefineries
- Independently be able to design and analyse production processes for converting biomass resource into biofuel

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, lab. exercises and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

BIOMASS GASIFICATION, COMBUSTION AND THEIR ADVANCED MODELLING

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module adds to the knowledge obtained in Heat transfer; Fundamentals of CFD; Combustion theory; Fluid mechanics.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Understand solid biomass feedstock: Fuel characterisation, thermochemical conversion and the various sub-processes, heat and mass transfer in biomass thermochemical conversion
- Understand radiation heat transfer without participating medium: Fundamentals, view factors, surface resistance and space resistance, network method
- Understand radiation heat transfer with participating medium: Radiative properties of gas mixture, radiative transfer equation, modelling of radiative heat transfer
- Have knowledge about biomass gasification and combustion on particle scale: Time scale analysis, ignition mechanisms, reactions of gasification, regimes of char reactions, modelling of biomass particle conversion
- Have knowledge about biomass gasification on reactor scale: Principles, key factors, types of gasifiers and their key characteristics, gasifier design, success stories of biomass gasification
- Have knowledge about suspension-firing of biomass: NO_x control by combustion, different arrangements of suspension-firing, modelling of suspension-firing – overview and specific issues, case studies
- Have knowledge about grate-firing of biomass: Key components in grate boilers, breakthrough, potential problems and solutions, modelling of grate-firing – general strategy and examples

SKILLS

- Be able to identify the appropriate utilisation technology for a given biomass based on its properties
- Understand thermal radiation heat transfer, various applications, and advanced modelling of radiation heat transfer without and with participating medium
- Understand the mechanisms and the key issues in biomass gasification and the modelling
- Understand the key sub-processes in biomass combustion and various key biomass combustion technologies (their advantages and disadvantages, and modelling strategies)
- Be able to developing key sub-models for biomass conversion and implementing them into commercial CFD

COMPETENCES

- Have in-depth understanding of all the important issues in biomass gasification and combustion, including combustion physics (e.g., radiative heat transfer, turbulent flow) and combustion chemistry (e.g., pyrolysis, homogeneous and heterogeneous reactions)
- Be able to develop sub-models and codes for the key, special processes in biomass gasification and combustion process and ability to perform a reliable CFD of biomass gasifier and combustor

TYPE OF INSTRUCTION

Lectures in combination with tutorials, assignments and hands-on.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Biomass Gasification, Combustion and their Advanced Modelling
Type of exam	Oral exam
ECTS	5
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

FACTS ABOUT THE MODULE

Danish title	Forgasning af biogas, forbrænding og avanceret modellering
Module code	N-EE-K3-13
Module type	Course
Duration	1 semester
Semester	Autumn
ECTS	5
Empty-place Scheme	Yes
Location of the lecture	Campus Aalborg, Campus Esbjerg
Responsible for the module	Chungen Yin

CONTROL OF GRID CONNECTED PHOTOVOLTAIC AND WIND TURBINE SYSTEMS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Offshore Energy Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Understand the operation principle of most common PV and WT systems
- Have knowledge about the most important single- and three-phase inverter topologies, used in renewable energy systems
- Have knowledge about the various pulse width modulation (PWM) techniques used with different inverter topologies
- Understand maximum power point trackers
- Have knowledge about different phase-lock loop (PLL) and control methods, current, voltage and power loops used in control schemes of grid connected inverters
- Have knowledge about grid requirements, standards describing anti-islanding methods, THD limits, etc. that grid connected inverters must comply with

SKILLS

- Be able to implement different PWM strategies for single- and three-phase converters
- Be able to verify different PLL methods based on laboratory experiments
- Be able to design/tune a control scheme for a grid connected converter

COMPETENCES

- Be able to create mathematical models for PV cells, panels and arrays
- Be able to develop simulation models for different PV and WT converter
- Be able to implement a grid connected converter control
- Understand the purpose and methods for grid support by renewable systems

TYPE OF INSTRUCTION

The course will be planned and organised in close interaction with on-going research and development activities at the Department of Energy Technology and its collaborators. Project topics are accounted for when determining the course content. Guest lecturers will also be involved if this is relevant to the course aims. All lectures include exercises focusing on the presented material. Some of the exercises will be done using MATLAB and Simulink. Several exercises will be performed in the PV-lab using experimental set-ups, like current control for a grid connected converter using dSPACE 1103. This way the participants will get a hands-on experience will real-life systems.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Control of Grid Connected Photovoltaic and Wind Turbine Systems
Type of exam	Written and oral exam Each student should submit all the laboratory exercises in the form of a report. The oral examination will be based on the submitted report and the presented material.
ECTS	5
Assessment	7-point grading scale
Type of grading	Internal examination
Criteria of assessment	As stated in the Joint Programme Regulations. http://www.engineering.aau.dk/uddannelse/studieadministration/

ELECTROCHEMICAL MODELLING OF FUEL CELLS, ELECTROLYSERS AND BATTERIES

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering, Sustainable Energy Engineering or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about the components that make up an electrochemical cell
- Understand the thermodynamics of fuel cells, electrolyzers and batteries
- Understand the relations governing the kinetics of electrochemical reactions
- Understand the mechanisms governing charge, mass and energy transport within electrodes and electrolytes
- Have knowledge about how to model catalyst poisoning
- Understand how the individual processes are coupled

SKILLS

- Be able to develop models for different types of electrodes
- Be able to combine electrode models with other sub models to create a full electrochemical cell model
- Be able to apply appropriate simplifications depending on the application

COMPETENCES

- Independently be able to analyse and model real electrochemical cells
- Independently be able to identify the validity or limitations of an electrochemical model
- Independently be able to simplify an electrochemical model so it is applicable in modelling of thermal or electrical systems

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

ENERGY CONVERSION AND STORAGE IN FUTURE ENERGY SYSTEMS

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge about the basic principles of electrochemical energy conversion
- Have knowledge about the different types of electrolysers, fuel cells and battery energy storage technologies
- Understand the operation/role of energy storage devices and their suitability for different applications (e.g., grid services, V2G, renewables' grid integration etc.)
- Have good knowledge about the performance (static and dynamic) behaviour of fuel cells, electrolysers and batteries and their dependence on the operating conditions (temperature, load current, etc.). Gain experience about different performance and thermal modelling approaches and model parameterization techniques
- Gain knowledge about the testing of fuel cells, electrolysers and batteries in the laboratory

SKILLS

- Be able to develop a simple model of an electrochemical cell or system
- Be able to test an electrolyser or fuel cell or battery
- Be able to evaluate the suitability of different energy storage technologies for various applications
- Be able to derive various parameters from laboratory measurements

COMPETENCES

- Be able to develop performance models for different battery technologies based on various requirements
- Independently be able to identify the validity or limitations of an electrochemical model
- Be able to analyse data from the fuel cell, electrolyser and battery tests

TYPE OF INSTRUCTION

The course will be planned and organised in close interaction with on-going research and development activities at the Department of Energy Technology and its collaborators. All lectures include exercises focusing on the presented material; some exercises will be performed using MATLAB and Simulink. Moreover, some exercises will be carried out on programmable battery test stations.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

EXAMS

FAULT TOLERANT CONTROL

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying courses on Non-linear control theory and multi-variable control.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have comprehension of the fundamental concepts, terms and methods used within fault tolerant control
- Have comprehension of failure mode and effect analysis (FMEA)
- Have comprehension of modelling faults in dynamic systems and closed loop control systems
- Have comprehension of analytical redundancy
- Have knowledge about statistical fault detection including cumulative sum and generalised likelihood tests
- Have comprehension of residual generation for detection and isolation and decision ruling
- Have comprehension of fault detection using both observers and parity methods

SKILLS

- Be able to use analyse fault development and mitigation approaches
- Be able to list considered faults, how they propagate through the system and assess their severity and occurrence likelihood
- Be able to design fault detection observers
- Be able to design fault detection with parity equations
- Be able to design a FDI observer for unknown inputs
- Be able to develop fault tolerant strategies for ensuring the continuation of the system in the presence of faults
- Be able to design both passive and active fault tolerant controller for continuous systems

COMPETENCES

- Be able to account for the considerations involved in the process of formulating and solving fault tolerant control problems, choosing suited approaches and implementing it in practice
- Be able to develop fault detection and isolation (FDI) algorithms

TYPE OF INSTRUCTION

The form(s) of teaching will be determined and described in connection with the planning of the semester. The description will account for the form(s) of teaching and may be accompanied by an elaboration of the roles of the participants. The programme is based on a combination of academic, problem oriented and interdisciplinary approaches and organised based on the following types of instruction that combine skills and reflection:

- lectures
- project work
- workshops
- exercises (individually and in groups)
- teacher feedback
- reflection
- portfolio work
- study circle
- self-study

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Fault Tolerant Control
Type of exam	Written exam

FUTURE POWER SYSTEM IN DENMARK

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical specialisation or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and understanding within the technique of the grid and system challenges that the electricity power system in Denmark is expected to face in the future in terms of design and system operation.

SKILLS

- Be able to explain the grid technique and systemic challenges of electricity supply in Denmark in the future facing, both design and / or terms of system operation
- Be able to analyse and assess the structure, composition, interaction and mutual influence between the relevant parts of the electricity grid and power system in one or more of the fields distribution, transmission, production and consumption
- Be able to use and through that become familiar with earlier learned electrical power system theory
- Be able to identify, evaluate, and argue for changes in existing power system facilities taking into consideration high personal security, high continuity of supply and finance

COMPETENCES

- Be able to explain the grid technique and systemic challenges of electricity supply in Denmark in the future facing, both design and / or terms of system operation
- Be able to analyse and assess the structure, composition, interaction and mutual influence between the relevant parts of the electricity grid and power system in one or more of the fields distribution, transmission, production and consumption
- Be able to use and through that become familiar with earlier learned electrical power system theory
- Be able to identify, evaluate, and argue for changes in existing power system facilities taking into consideration high personal security, high continuity of supply and finance

TYPE OF INSTRUCTION

The course will include lectures; guest-lectures; team work; web-conferences/question time; and conference. With starting point in Denmark's existing electrical power system, and known political objectives and decisions for Denmark (at regional or national level), students must analyse their way through to a concrete solution for the future electricity supply in Denmark, based on the course's theme and within a more defined, self-elected project focus.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Future Power System in Denmark
Type of exam	Written and oral exam Oral examination based on a delivered mini-project/test report (individual or made in groups).

MODERN ELECTRICAL DRIVES

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Offshore Energy Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have a solid knowledge about the electromagnetic field behaviour for various types of electrical machines. This gives a firm base for understanding of the advantages and disadvantages of different types of electrical machines. It consequently leads to a good understanding of new types of machines invented in recent years, e.g. the modern drive unit in electric vehicles or wind turbines, and magnetic gears.
- Have a detailed knowledge of the small DC link drive system and the corresponding active damping control methods. This has become a hot topic in recent years.
- Gain good experience about design of various controllers to meet different requirements, e.g. very low speed stable operation, low-cost controller design, drive stability issues, etc.

SKILLS

- Be able to understand and evaluate new types of high performance electrical machines that may occur in the future
- Be able to identify the pros and cons of existing sensorless control methods and design the most proper controller for selected applications
- Be aware of important practical implementation issues when designing the controller
- Be able to test, measure and characterize the performance of different electrical drive systems

COMPETENCES

- Independently be able to contribute to a professional team dealing with design of modern electrical drives, including new high performance electrical machines and advanced control technologies

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises, mini-projects and self-studies. Instead of using complicated mathematical equations and electromagnetic theory, particularly-made Finite Element Models visualizing the electromagnetic field behaviour inside a machine will be used to give an easy but deep access to many difficult topics involved in the electrical machine theory. Various advanced sensorless control technologies developed in recent years will be discussed for permanent magnet machine and synchronous reluctance machine (which has received great interests in recent years). Achievements obtained from recent PhD projects carried out at the department will be presented.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**

Name of exam	Modern Electrical Drives
Type of exam	Written and oral exam Oral examination based on a delivered mini-project/test report (individual or made in groups).

MODERN POWER ELECTRONIC DEVICES AND THEIR MODELS

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Offshore Energy Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have a basic knowledge about figure of merit of present and future wide-bandgap semiconductor materials (SiC, GaN, GaO, diamond, etc.)
- Have a solid knowledge about operating principles and founding equations of modern power electronic devices: SCRs, MOSFETs, IGBTs, rectifiers, FR diodes, Schottky diodes, HEMTs, etc.
- Have a solid knowledge about operating range basing on real-life application, like LVDO, POL, power supplies, welding machines, solar inverters, wind turbines, HVDC, etc.
- Have a basic knowledge about power electronic device design principles, constraints and trade-offs
- Have a good understanding of simulation tools, both at device level and circuit level (PSpice, LTSpice, etc.)
- Understanding of the interaction between the external circuit, including driving circuit, and the power electronic device
- Have a good knowledge about abnormal conditions and instabilities
- Have a hands-on experience on real problems related to power electronic devices, as driver selection, heatsink thermal design, losses and efficiency estimation and measurement

SKILLS

- Be able to recognise and classify traditional and modern power semiconductor devices
- Be able to test and characterize real power devices, both statically and dynamically
- Be able to simulate with good accuracy electrical behaviour of power electronic devices, including power losses and junction temperature estimation
- Be able to select an appropriate power devices for a given real application, e.g. DC/DC or DC/AC converters
- Experience gained from practical tasks will let you be aware of important implementation issues when designing power electronic circuits, e.g. thermal design, safe operating area, etc.

COMPETENCES

- Be able to contribute to a professional team in design of power electronic circuits with skills on part number selection, driving design and simulation of traditional and modern power electronic components

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises, mini-projects and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

SYSTEM IDENTIFICATION AND DIAGNOSIS

2018/2019

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have comprehension of the fundamental principles of typical methods of system identification
- Have comprehension of the fundamental concepts, terms and methodologies of abnormal diagnosis
- Have comprehension of some typical model-based and signal-based diagnosis

SKILLS

- Be able to apply the learned knowledge to handle some simple system identification problems under assistance of a commercial software
- Be able to apply and analyse different diagnosis methods

COMPETENCES

- Independently be able to define and analyse scientific problems within the area of system identification and diagnosis
- Independently be able to be a part of professional and interdisciplinary development work within the area of system identification and diagnosis

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises, mini-projects and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM

TEST AND VALIDATION

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module builds upon knowledge obtained in the modules Applied Statistics and Probability Theory or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Understand methodology for design of experiments and test series and for reduction of ambiguity of experimental results, and for comparability with model predictions
- Explain elementary and advanced quantification tools, and their application to validation between model and experiment data
- Account for common contemporary methods and relevant specific industry standards
- Understand processing methods for analog and digital data (continuous vs. discrete)

SKILLS

- Scrutinize a non-trivial physical systems for appropriate experimental study
- Isolate principal measurable parameters
- Design an experiment matrix for systematic variation of parameters
- Perform a probabilistic study of the experimental data in order to quantify the influence of individual parameters
- Scrutinize a model (analytical or numerical) for comparison with an appropriate experimental study
- Isolate principal input parameters and their known or assumed statistical variations
- Perform a probabilistic study of the model in order to quantify the level of confidence
- Account for the level of coherence between test results and model predictions
- Identify invalid data (outliers)
- Account for common errors and limitations in the processing of model data or experimentally obtained data

COMPETENCES

- Undertake experiment planning and execution for refinement and validation (or rejection) of model-based predictions of phenomena within their principal line of study

TYPE OF INSTRUCTION

The course is taught by a mixture of lectures, workshops, exercises, mini-projects and self-studies.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

WIND POWER SYSTEM AND RENEWABLE ENERGY GRID INTEGRATION

2018/2019

PREREQUISITE/RECOMMENDED PREREQUISITE FOR PARTICIPATION IN THE MODULE

The module is based on knowledge achieved when studying the 2nd semester on the Master of Science in Energy Engineering with an electrical specialisation or Master of Science in Sustainable Energy Engineering with specialisation in Offshore Energy Systems or similar.

CONTENT, PROGRESS AND PEDAGOGY OF THE MODULE

LEARNING OBJECTIVES

KNOWLEDGE

- Have knowledge and comprehension within electrical system overview of wind energy conversion systems
- Have knowledge and comprehension within wind power generators
- Have knowledge and comprehension within the power electronics converters in wind power conversion system
- Have knowledge and comprehension within the wind turbine systems
- Have knowledge and comprehension within optimisation theory and its application on offshore wind farms and electrical systems
- Have knowledge and comprehension within operation and control of wind turbines and wind farms
- Have knowledge and comprehension within renewable energy sources in transmission power systems
- Have knowledge and comprehension within renewable energy sources in distribution power systems

SKILLS

- Be able to apply theories to analyse wind turbine systems
- Be able to apply power flow analysis of large renewable energy systems
- Be able to implement optimisation in an offshore wind farm and design its electrical systems
- Be able to simulate the different grid-connected wind turbine systems, including Double Fed Induction Generator (DFIG) based wind turbines and Permanent Magnet Synchronous Generator (PMSG) based wind turbines
- Be able to analyse the impact of renewable energy sources on the power system

COMPETENCES

- Be able to understand the state-of-art knowledge within the area of renewable energy
- Independently be able to define and analyse scientific problems within the area of wind power systems
- Independently be able to communicate results from advanced wind power technology
- Independently be able to be a part of professional and interdisciplinary development work in renewable energy technology

TYPE OF INSTRUCTION

Lectures, exercises, simulations and group discussions.

EXTENT AND EXPECTED WORKLOAD

Since it is a 5 ECTS course module, the work load is expected to be 150 hours for the student.

EXAM**EXAMS**
